

# EVE 402 Air Pollution Generation and Control

## Chapter #5 Lectures (Part 6)

© 2009 Jones and Bartlett Publishers, LLC (www.jbpub.com)

---

---

---

---

---

---

---

---

## Fabric Filtration

- One of the oldest and most widely-used methods for separating particles from a gas stream
- Particle-laden gas flows through a number of filter bags, leaving the particles retained on the fabric
- Constructed of any material compatible with gas and particulate
- May be cleanable or non-cleanable (discarded after use)

© 2009 Jones and Bartlett Publishers, LLC (www.jbpub.com)

---

---

---

---

---

---

---

---

## Typical Dimensions

Dirty gas flows into page

Fabric material may be woven, felted, or knitted

© 2009 Jones and Bartlett Publishers, LLC (www.jbpub.com)

---

---

---

---

---

---

---

---

### Woven Fabric

- Particles deposit on surface of fabric
- Woven fabric has lower collection efficiency
- Dust layer presents a significant surface for collection

© 2009 Jones and Bartlett Publishers, LLC (www.jbpub.com)

---

---

---

---

---

---

---

---

### Felt Fabric

- Surface of felt supports dust cake
- Used in pulse jet filters

© 2009 Jones and Bartlett Publishers, LLC (www.jbpub.com)

---

---

---

---

---

---

---

---

### The Pros and Cons

- Pros
  - High collection efficiency even for small particles
  - Can operate on a wide variety of dust types
  - Wide choices of filters depending on application
  - Simultaneous removal of particles and some gases
  - Modular in design (simplifies maintenance)
  - Can operate over an extremely wide range of volumetric flow rates (100 – 5x10<sup>6</sup> ft<sup>3</sup>/m)
  - Requires reasonably low pressure drop
  - Lower capital cost than an electrostatic precipitator (ESP)
- Cons
  - Requires large foot print
  - Fabric can be harmed by high temperatures or corrosive gases
  - Inappropriate for moist environments
  - Potential for fire or explosion from static charge
  - Higher annual cost than an ESP
  - Higher pressure drop compared to an ESP

© 2009 Jones and Bartlett Publishers, LLC (www.jbpub.com)

---

---

---

---

---

---

---

---

## Baghouse Collection Efficiency

- Collection efficiency is generally *not* a concern in the design of a baghouse
- A well designed, well maintained fabric filter that is operated properly generally collects particles from 0.5 to 100 μm at efficiencies of greater than 99%
- The remaining design involves optimizing filtering velocity to balance capital costs and operating costs

---

---

---

---

---

---

---

## Typical Values for Fabric Filtration Units

$$0.1 \frac{\text{m}^3/\text{min}}{\text{m}^2} \leq \frac{Q}{A_{x-s}} \leq 10 \frac{\text{m}^3/\text{min}}{\text{m}^2}$$

$$2 \text{ cm H}_2\text{O}_{(l)} \leq \Delta P \leq 25 \text{ cm H}_2\text{O}_{(l)}$$

$$0^\circ\text{C} \leq T \leq 800^\circ\text{C}$$

$$10 \text{ cm} \leq \text{diameter of filter tube} \leq 30 \text{ cm}$$

$$0.5 \text{ m} \leq \text{length of fabric tube} \leq 10 \text{ m}$$

$$1 \leq \text{number of compartments} \leq 20$$

---

---

---

---

---

---

---

---

Baghouses are named according to how the dirty bags are cleaned:

- Reverse-air
- Shaker
- Pulse-jet
- Cartridge filter designs

---

---

---

---

---

---

---

---

© 2009 Jones and Bartlett Publishers, LLC (www.jbpub.com)

Reverse Air Baghouse

- Uses compartmentalized designs
- Named "reverse air" from the cleaning method
- During cleaning the gas flow through a compartment is stopped, and filtered gas is passed in a reverse direction through the bags
- Bags are hung from top of compartments
- Bags attached by springs on top

---

---

---

---

---

---

---

---

Reverse Air Baghouse

- Bottoms of bags are attached to a plate called tube sheet mounted right above the hopper
- Dirty air enters the inside of each reverse air bag
- The dust cake accumulates on the interior surfaces of the bags
- The dust cake causes most of the filtration

© 2009 Jones and Bartlett Publishers, LLC (www.jbpub.com)

---

---

---

---

---

---

---

---

## Reverse Air Baghouse

© 2009 Jones and Bartlett Publishers, LLC (www.jbpub.com)

---

---

---

---

---

---

---

---

---

---

To gauge proper operation the following may be used:

- Double pass transmissometer
  - Measures opacity; source/receiver on same side
- Bag-break monitor
- Pressure gauge
  - Measures overall pressure drop
  - Measures compartment pressure drop
  - Measures pressure of reverse air stream during cleaning
- Inlet and outlet gas thermometers
  - Ensure temperature doesn't exceed fabric rating

© 2009 Jones and Bartlett Publishers, LLC (www.jbpub.com)

---

---

---

---

---

---

---

---

---

---

## Pulse Jet Baghouse

- Dirty gas enters upper portion of hopper and passes vertically up between the bags during filtering
- Dust accumulates on the outside surfaces of the bags
- Named "pulse jet" because of the cleaning method
- Pulse of compressed air is used for cleaning each of the bags

© 2009 Jones and Bartlett Publishers, LLC (www.jbpub.com)

---

---

---

---

---

---

---

---

---

---

### Pulse Jet Bags

- Cleaned air enters the cylindrical bags and moves upward into the clean gas plenum at the top of the baghouse
- The outlet duct from the plenum takes the cleaned air to the fan and out to the stack

---

---

---

---

---

---

---

---

### Pulse Jet Baghouse

---

---

---

---

---

---

---

---

### Looking up into an array of bags in a Pulse Jet Baghouse

---

---

---

---

---

---

---

---

© 2009 Jones and Bartlett Publishers, LLC (www.jbpub.com)

### Pulse Jet Baghouse

- Bags are cleaned by introducing a high-pressure pulse of compressed air at the top of each bag
- Pulse generates a pressure wave that travels down inside the bag
- This cracks the dust cake on the outside of the bags and causes some of the dust to fall into the hopper
- Cleaning is done row by row while baghouse is operating

© 2009 Jones and Bartlett Publishers, LLC (www.jbpub.com)

---

---

---

---

---

---

---

---

### Shaker Baghouses

- Shaking bag in a simple harmonic or sinusoidal motion on the order of a few inches
- Every 30 sec to few minutes

© 2009 Jones and Bartlett Publishers, LLC (www.jbpub.com)

---

---

---

---

---

---

---

---

---

---

---

---

---

## Filter Characteristics

- Filter medium serves as a structural support rather than impaction surface
- Packing Density

$$\alpha = \frac{\text{fiber volume}}{\text{total volume}} = 1 - \text{porosity}$$

For fiber filter,  $\alpha < 0.1$

For woven filter,  $\alpha \sim 0.3$

© 2009 Jones and Bartlett Publishers, LLC (www.jbpub.com)

---

---

---

---

---

---

---

---

---

---

## Filter Materials

- Woven fabric
  - Interlaced yarn type
- Felted fabric
  - Randomly oriented fibers
- Membranes
  - PTFE laminated to a woven fabric or felt
- Sintered metal fibers
  - Small metal fibers randomly oriented on a cylinder
- Ceramic cartridges
  - Fabricated on honeycomb or cylinder

## Pressure Drops

- Pressure drop across the baghouse is given as

$$\Delta P = \Delta P_F + \Delta P_C + \overset{0}{\Delta P_S} \quad \text{Eq. 5 - 89, p. 253}$$

where:

$\Delta P_F$  = pressure drop across fabric

$\Delta P_C$  = pressure drop across particle (or cake) layer

$\Delta P_S$  = pressure drop across the structure (negligible)

- The flow through the filter and cake layer is assumed to be viscous (i.e.,  $\mu_g$  is important)
  - Thus  $\Delta P$  may be represented by Darcy's equation:

$$\Delta P = \Delta P_F + \Delta P_C = \frac{\mu_g x_F V}{K_F} + \frac{\mu_g x_C V}{K_C}$$

© 2009 Jones and Bartlett Publishers, LLC (www.jbpub.com)

---

---

---

---

---

---

---

---

## Pressure Drops (2)

$$\Delta P = \Delta P_F + \Delta P_C = \frac{\mu_g x_F V}{K_F} + \frac{\mu_g x_C V}{K_C}$$

where

$\mu_g$  = gas viscosity

$x_F, x_C$  = filter and cake layer thicknesses, respectively

$K_F, K_C$  = filter and cake layer permeabilities, respectively

$V$  = superficial filtering velocity (air-to-cloth ratio)

© 2009 Jones and Bartlett Publishers, LLC (www.jbpub.com)

---

---

---

---

---

---

---

---

---

---

## Air-to-Cloth Ratio

Superficial filtration velocity (average velocity) also known as the air-to-cloth ratio

$$V = \frac{Q}{A}$$

$Q$  = volumetric gas flow rate, m<sup>3</sup>/min

$A$  = cloth area, m<sup>2</sup>

Typical Air-to-Cloth Ratios

Baghouse Cleaning Method	Air-to-Cloth Ratio
Shaking	2 – 6 (ft <sup>3</sup> /min)/ft <sup>2</sup>
Reverse air	1 – 3 (ft <sup>3</sup> /min)/ft <sup>2</sup>
Pulse jet	5 – 15 (ft <sup>3</sup> /min)/ft <sup>2</sup>

© 2009 Jones and Bartlett Publishers, LLC (www.jbpub.com)

---

---

---

---

---

---

---

---

---

---

## Dust Cake Growth

- Over time, the depth of the dust layer (dust cake) increases

$$x_c = \frac{C_i V t}{\rho_c} \quad \text{Eqn (5-91), p. 254}$$

where:

$C_i$  = dust loading, kg/m<sup>3</sup>

$V$  = filtration velocity, m/s

$t$  = time of operation, min

$\rho_c$  = bulk density of the particulate layer, kg/m<sup>3</sup>

$\rho_c = \rho_p c$

$c$  = packing density

© 2009 Jones and Bartlett Publishers, LLC (www.jbpub.com)

---

---

---

---

---

---

---

---

---

---

## Pressure Drop

$\Delta P = \Delta P_R + \Delta P_c (+\Delta P_s)$  Pressure drop through the baghouse

$\Delta P = K_1 V + K_2 (C_i V t) V$   $C_i = \text{dust loading, kg/m}^3$

Areal Dust Density  $W = C_i V t$

Filter drag

$S = \frac{\Delta P}{V} \Rightarrow S = K_1 + K_2 W$  in Pa-min/m

$K_1$  and  $K_2$  to be determined empirically (resistance factor)

$\Delta P_R = \text{fabric pressure drop}$

$\Delta P_c = \text{particle cake layer pressure drop}$

$\Delta P_s = \text{structure pressure drop}$

© 2009 Jones and Bartlett Publishers, LLC (www.jbpub.com)

---

---

---

---

---

---

---

---

## Typical filter drag, S, vs. areal dust density curves for various degrees of cleaning

---

---

---

---

---

---

---

---

## Variation of $\Delta P$ with Time

$t_f = N(t_r + t_c) - t_c$

where,

$t_f = \text{filtration time (the elapsed time a compartment runs between cleanings)}$

$t_r = \text{run time (the time elapsed between cleanings of any two compartments)}$

$t_c = \text{cleaning time (the time required to clean one compartment)}$

$N = \text{total number of compartments}$

---

---

---

---

---

---

---

---

## Applications

- A baghouse for a 250 MW utility boiler may have 5,000 separate bags with a total fabric area approaching 500,000 square feet
- Most cement plants have between 40 and 80 separate fabric filter control systems ranging in size from 30 actual cubic meters per minute capacity to more than 100,000 actual cubic meters per minute capacity
- Typical asphalt plants use either stationary or portable baghouses that are capable of handling 300 to 2,200 cubic meters per minute at 300 - 400°F. Material collected is aggregate dust from an asphalt drum mix or batch plant drying process

## Example (Fabric Filtration)

A fabric filter will be used downstream of a spray dryer to remove particulate material from a gas stream. Actual concentration of particulate matter is  $10 \text{ g m}^{-3}$  upstream of the fabric filter. A pilot plant was built and operated downstream of the spray dryer to characterize the behavior of the filter cake and fabric under actual conditions. Pilot plant data are presented.
