Write a function to help you determine the best basketball player (among Kobe Bryant, LeBron James, and Dwayne Wade) based on each player’s statistics for his **first 10 games played since January 1, 2006**. Note that this problem is different from the Lesson #27 HW. In this assignment, each player’s array will include points, assists, rebounds, and turnovers for 10 games (so, you’ll have a 2-dimensional array for each player). Your function must do two things:

1. accept an array for each player with points, assists, rebounds, and turnovers for 10 games,
2. access the array elements appropriately to determine per-game averages for points, assists, rebounds, and turnovers, and
3. calculate an overall score based on the formula
   $$\text{score} = 0.2*(\text{avg pts}) + 0.2*(\text{avg assts}) + 0.15*(\text{avg reb}) – 0.25*(\text{avg t/o})$$

Output should appear as follows:

Kobe’s score: XX.YY
LeBron’s score: XX.YY
Dwayne’s score: XX.YY

?? is the best player in the NBA based on the first 10 games played Since January 1, 2006.
