Shearing Stresses in Beams and Thin Walled Members**David F. Mazurek**

### **MECHANICS OF MATERIALSSixthBeer • Johnston • DeWolf • Mazurek Edition Introduction**

σ.

- Transverse loading applied to a beam results in normal and shearing stresses in transverse sections.
- • Distribution of normal and shearing stresses satisfies

$$
F_x = \int \sigma_x dA = 0 \qquad M_x = \int (y \tau_{xz} - z \tau_{xy}) dA = 0
$$
  
\n
$$
F_y = \int \tau_{xy} dA = -V \qquad M_y = \int z \sigma_x dA = 0
$$
  
\n
$$
F_z = \int \tau_{xz} dA = 0 \qquad M_z = \int (-y \sigma_x) = M
$$

- When shearing stresses are exerted on the vertical faces of an element, equal stresses must be exerted on the horizontal faces
- Longitudinal shearing stresses must exist in any member subjected to transverse loading.

A beam is made of three planks, nailed together. Knowing that the spacing between nails is 25 mm and that the vertical shear in the beam is  $V = 500$  N, determine the shear force in each nail.

### SOLUTION:

- Determine the horizontal force per unit length or shear flow *q* on the lower surface of the upper plank.
- Calculate the corresponding shear force in each nail.

*Q*=*Ay* $= (0.020 \,\mathrm{m} \times 0.100 \,\mathrm{m})(0.060 \,\mathrm{m})$  $(0.020\,\text{m})(0.100\,\text{m})^3$  $(0.100\,\text{m})(0.020\,\text{m})^3$  $(0.020\,{\rm m}\!\times\!0.100\,{\rm m})(0.060\,{\rm m})^2$  ] 64 $=16.20\times 10^{-6}$  m  $+(0.020\,\text{m} \times 0.100\,\text{m})(0.060\,\text{m})^2$  $12^{(0.100 \text{ m})(0.020 \text{ m})}$ 1 $+2[\frac{1}{12}(0.100\,\text{m})(0.020\,\text{m})]$  $12^{(0.626 \text{ m})(0.100 \text{ m})}$ 1 $\frac{1}{12}$ (0.020 m)(0.100 m 63 $=120\times 10^{-6}$  m =*I*

### SOLUTION:

• Determine the horizontal force per unit length or shear flow *q* on the lower surface of the upper plank.

$$
q = \frac{VQ}{I} = \frac{(500 \text{N})(120 \times 10^{-6} \text{m}^3)}{16.20 \times 10^{-6} \text{m}^4}
$$

$$
= 3704 \frac{\text{N}}{\text{m}}
$$

• Calculate the corresponding shear force in each nail for a nail spacing of 25 mm.

$$
F = (0.025 \,\mathrm{m})q = (0.025 \,\mathrm{m})(3704 \,\mathrm{N/m})
$$

*F* $= 92.6 N$ 

#### **MECHANICS OF MATERIALSSixthBeer • Johnston • DeWolf • Mazurek Edition** Determination of the Shearing Stress in a Beam

End

 $\bullet$  The *average* shearing stress on the longitudinal surface of the element is obtained by dividing the shearing force on the element by the area of the face.

$$
\tau_{ave} = \frac{\Delta H}{\Delta A} = \frac{q \Delta x}{\Delta A} = \frac{VQ}{I} \frac{\Delta x}{t \Delta x}
$$

$$
= \frac{VQ}{It}
$$

- On the upper and lower surfaces of the beam,  $\tau_{yx}$ = 0. It follows that  $\tau_{xy}$ = 0 on the upper and lower edges of the cross-sections.
- If the width of the beam is comparable or large relative to its depth, the shearing stresses at  $D_1^{\phantom{\dag}}$ and  $D_2$  are significantly higher than at  $D$ .

#### **MECHANICS OF MATERIALSSixthBeer • Johnston • DeWolf • Mazurek Edition Shearing Stresses**  $\tau$ *xy* in Common Types of Beams

• For a narrow rectangular beam,

$$
\tau_{xy} = \frac{VQ}{Ib} = \frac{3V}{2A} \left( 1 - \frac{y^2}{c^2} \right)
$$

$$
\tau_{\text{max}} = \frac{3V}{2A}
$$

• For American Standard (S-beam) and wide-flange (W-beam) beams

$$
\tau_{ave} = \frac{VQ}{It}
$$

$$
\tau_{max} \approx \frac{V}{A_{web}}
$$

Graw

A timber beam is to support the three concentrated loads shown. Knowing that for the grade of timber used,

 $\sigma_{all} = 1800 \,\text{psi} \qquad \tau_{all} = 120 \,\text{psi}$ 

determine the minimum required depth *d* of the beam.

### SOLUTION:

- Develop shear and bending moment diagrams. Identify the maximums.
- Determine the beam depth based on allowable normal stress.
- Determine the beam depth based on allowable shear stress.
- Required beam depth is equal to the larger of the two depths found.

 $\triangle$ 

End

Mc<br>Graw<br>Hill

#### SOLUTION:

Develop shear and bending moment diagrams. Identify the maximums.

> $_{\text{max}} = 7.5 \text{kip} \cdot \text{ft} = 90 \text{kip} \cdot \text{in}$  $V_{\text{max}}=3\text{kips}$  $M_{\text{max}} = 7.5 \,\text{kip} \cdot \text{ft} = 90 \,\text{kip} \cdot$

End

• Determine the beam depth based on allowable normal stress.

$$
\sigma_{all} = \frac{M_{\text{max}}}{S}
$$
  
1800 psi =  $\frac{90 \times 10^3 \text{ lb} \cdot \text{in.}}{(0.5833 \text{ in.})d^2}$   
d = 9.26 in

 $d = 9.26$ in.

• Determine the beam depth based on allowable shear stress.

$$
\tau_{all} = \frac{3}{2} \frac{V_{\text{max}}}{A}
$$
  
120 psi =  $\frac{3}{2} \frac{3000 \text{ lb}}{(3.5 \text{ in.})d}$   
 $d = 10.71 \text{ in.}$ 

• Required beam depth is equal to the larger of the two.  $d = 10.71$ in.

# **MECHANICS OF MATERIALSSixthBeer • Johnston • DeWolf • Mazurek** Longitudinal Shear on a Beam Element

of Arbitrary Shape

**Edition**

- We have examined the distribution of the vertical components  $\tau$ ,  $\tau_{xy}$  on a transverse section of a beam. We now wish to consider the horizontal components  $\tau_{\rm s}$  $\tau_{xz}$  of the stresses.
- Consider prismatic beam with an element defined by the curved surface CDD'C'.

$$
\sum F_x = 0 = \Delta H + \int_a (\sigma_D - \sigma_C) dA
$$

• Except for the differences in integration areas, this is the same result obtained before which led to

$$
\Delta H = \frac{VQ}{I} \Delta x \qquad q = \frac{\Delta H}{\Delta x} = \frac{VQ}{I}
$$

#### SOLUTION:

- Determine the shear force per unit length along each edge of the upper plank.
- Based on the spacing between nails, determine the shear force in each nail.

A square box beam is constructed from four planks as shown. Knowing that the spacing between nails is 1.5 in. and the beam is subjected to a vertical shear of magnitude  $V = 600$  lb, determine the shearing force in each nail.

For the upper plank, $Q = A'y = (0.75$ in.) $(3$ in.) $(1.875$ in.)  $=4.22$ in<sup>3</sup>

For the overall beam cross-section, $(4.5\text{in})^4 - \frac{1}{12}(3\text{in})^4$  $= 27.42 \text{ in}^4$  $12^{(2)}$  $\frac{1}{12}(4.5\text{in})^4 - \frac{1}{12}$ 1 $I = \frac{1}{12} (4.5 \text{in})^4 - \frac{1}{12} (3 \text{in})$ 

#### SOLUTION:

• Determine the shear force per unit length along each edge of the upper plank.

$$
q = \frac{VQ}{I} = \frac{(600 \text{ lb})(4.22 \text{ in}^3)}{27.42 \text{ in}^4} = 92.3 \frac{\text{lb}}{\text{in}}
$$
  

$$
f = \frac{q}{2} = 46.15 \frac{\text{lb}}{\text{in}}
$$
  
= edge force per unit length

• Based on the spacing between nails, determine the shear force in each nail.

$$
F = f \ell = \left(46.15 \frac{\text{lb}}{\text{in}}\right) (1.75 \text{in})
$$

$$
F = 80.81b
$$

#### **MECHANICS OF MATERIALSSixthBeer • Johnston • DeWolf • Mazurek Edition** Shearing Stresses in Thin-Walled Members

- Consider a segment of a wide-flange beam subjected to the vertical shear *V*.
- The longitudinal shear force on the element is

$$
\Delta H = \frac{VQ}{I} \Delta x
$$

- The corresponding shear stress is*ItVQt <i>x l H* $z_x = i_{xz} \approx \frac{1}{t \Delta x}$  $\Delta x$ ∆ $\tau_{\tau r} = \tau_{\tau r} \approx -$ = $\tau$ ≈
- Previously found a similar expression for the shearing stress in the web

$$
\tau_{xy} = \frac{VQ}{It}
$$

• NOTE:  $\tau_{xy} \approx 0$  in the flanges  $\tau_{xz} \approx 0$  in the web

#### **MECHANICS OF MATERIALSSixthBeer • Johnston • DeWolf • Mazurek Edition** Shearing Stresses in Thin-Walled Members

• The variation of shear flow across the section depends only on the variation of the first moment.

$$
q = \tau t = \frac{VQ}{I}
$$

- For a box beam, *q* grows smoothly from zero at A to a maximum at *C* and *C'* and then decreases back to zero at *E*.
- The sense of *q* in the horizontal portions of the section may be deduced from the sense in the vertical portions or the sense of the shear *V*.

#### **MECHANICS OF MATERIALSSixthBeer • Johnston • DeWolf • Mazurek Edition** Shearing Stresses in Thin-Walled Members

End

- For a wide-flange beam, the shear flow increases symmetrically from zero at *A*and *A'*, reaches a maximum at *C* and then decreases to zero at *E* and *E'*.
- The continuity of the variation in *q* and the merging of *q* from section branches suggests an analogy to fluid flow.

#### **MECHANICS OF MATERIALSSixthBeer • Johnston • DeWolf • Mazurek Edition** Plastic Deformations

- $\gamma = -\frac{1}{c}\sigma_Y = \text{maximum elastic moment}$ *cI*• Recall:  $M_Y = -\sigma$
- For  $M = PL < M<sub>y</sub>$ , the normal stress does not exceed the yield stress anywhere along the beam.
- For  $PL > M_Y$ , yield is initiated at *B* and *B'*. For an elastoplastic material, the half-thickness of the elastic core is found from

$$
Px = \frac{3}{2}M_Y \left(1 - \frac{1}{3}\frac{y_Y^2}{c^2}\right)
$$

• The section becomes fully plastic  $(y<sub>y</sub> = 0)$  at the wall when

$$
PL = \frac{3}{2} M_Y = M_p
$$

• Maximum load which the beam can support is *LM* $P_{\text{max}}=\frac{P}{I}$ 

*© 2012 The McGraw-Hill Companies, Inc. All rights reserved.* **3- <sup>18</sup>**

#### **MECHANICS OF MATERIALSSixthBeer • Johnston • DeWolf • Mazurek Edition** Plastic Deformations

 $\eta$ **PLASTIC** E  $\tau_{xy}$  $2y_Y$ **ELASTIC**  $\tau_{\rm max}$  $E'$  $C'$ **PLASTIC** 

- Preceding discussion was based on normal stresses only
- Consider horizontal shear force on an element within the plastic zone,

$$
\Delta H = -(\sigma_C - \sigma_D)dA = -(\sigma_Y - \sigma_Y)dA = 0
$$

Therefore, the shear stress is zero in the plastic zone.

- Shear load is carried by the elastic core, *AP* $\equiv \frac{\ }{\alpha \rightarrow \prime}$  $A' = 2by$ *y* $\frac{P}{A'}$  1 –  $\frac{y}{y}$ *P* $\frac{1}{\sqrt{2}}$   $1 - \frac{1}{2}$  where  $A - 20y$  *Yxy* 2where  $A' =$ | l  $\bigg)$ l l  $\setminus$  $\Big($ <sub>1</sub>  $\Big)$  $=\frac{1}{2}$  $\frac{1}{4'}$ 3 $\tau_{\text{max}} =$  $1-\frac{y}{2}$  where  $A'=2$  $2 A' \frac{1}{2}$ 3 $\gamma \left| \right|^{1}$  2 2 $\tau_{\rm w} = \frac{2}{\tau} = \frac{1}{2} = \frac{1}{2}$
- As *A*' decreases,  $\tau_{max}$  increases and may exceed  $\tau_{\text{\tiny{Y}}}$

### SOLUTION:

- For the shaded area,  $Q = ( 4.31 \text{in} ) ( 0.770 \text{in} ) ( 4.815 \text{in} )$  $=15.98$ in<sup>3</sup>
- $\bullet$ The shear stress at *a*,

$$
\tau = \frac{VQ}{It} = \frac{(50 \text{kips})(15.98 \text{in}^3)}{(394 \text{in}^4)(0.770 \text{in})}
$$

 $\tau=2.63$ ksi

Knowing that the vertical shear is 50 kips in a W10x68 rolled-steel beam, determine the horizontal shearing stress in the top flange at the point *a*.
