

### Combining Factors – Shifted Uniform Series

Question: What is  $P$  for the following cash flow, a shifted uniform series of  $n$  equal installments? The first installment occurs at the end of period 5.

---

---

---

---

---

---

---

---

---

---

### Combining Factors – Shifted Uniform Series

Approaches for finding  $P$ :

- Use  $(P/F)$  for each of the  $n$  payments.
- Use  $(F/P)$  for each of the payments to find  $F_T$ , then use  $F_T(P/F, i\%, n+4)$  to find  $P$ .
- Use  $(P/A)$  to find the  $P_4$ , then use  $P_4(P/F, i\%, 4)$  to find  $P$ .

---

---

---

---

---

---

---

---

---

### Combining Factors – Shifted Uniform Series

Example: What is  $P$  for a computer you purchase in which installments of \$200 are paid for 10 months, with the first payment deferred until the 5<sup>th</sup> month after purchase. Assume  $i = 0.5\%$  per month.

$A = \$200$

$P_4 =$  \_\_\_\_\_

$P =$  \_\_\_\_\_

$P =$  \_\_\_\_\_

---

---

---

---

---

---

---

---

---

---

### Combining Factors – Shifted Uniform Series

Example: What is the present worth of an account in which you invest \$2000 beginning now and at the end of each year for 10 years? The account pays interest at 6%.

$P =$  \_\_\_\_\_

$P =$  \_\_\_\_\_

---

---

---

---

---

### Combining Factors – Shifted Uniform Series

Example: What is  $F$  for the cash flow shown above, in which installments of \$200 are paid at the end of periods 5 through 14? Assume  $i = 5\%$ .

$A =$  \_\_\_\_\_

$F =$  \_\_\_\_\_

$F =$  \_\_\_\_\_

What is the account worth in period 20 (no installments made after period 14)?

---

---

---

---

---

---

---

---

### Combining Factors – Single Amounts and Uniform Series

How might you approach the above cost flow? \$200 paid in periods 1,2,3,4,6,7,8,9,10; and \$400 paid in periods 5.
